## GLYCOPEPTIDE ANTIBACTERIAL COMPOUNDS AND METHODS OF USING SAME

### CROSS REFERENCE TO RELATED APPLICATIONS

[0001] This application claims priority to Provisional Application Ser. No. 60/199,359, filed Apr. 25, 2000.

### FIELD OF THE INVENTION

[0002] The present invention relates to the preparation of derivatives of natural products and the determination of their activity. In particular, the present invention relates to novel derivatives of glycopeptide antibiotics, such as vancomycin, and their uses for the treatment of bacterial infection.

### BACKGROUND OF THE INVENTION

[0003] An example of a known glycopeptide antibiotic is vancomycin, which contains a disaccharide substituent linked to a heptapeptide structure. See Malabarba A., et al., *Med. Res. Rev.*, 17(1):69-137 (1997a); Nagarajan R. et al., *J. Chem. Soc. Chem. Comm.* 1306-1307(1988); Nagarajan R., *Antimicrob. Agents Chemother.*, 35:605-609 (1991); and Nagarajan R., *J. Antibiotics*, 46:1181-1195 (1993). Vancomycin is effective against gram positive bacteria. However, vancomycin resistant strains have been recently observed, thus increasing the need for new and effective therapeutic agents.

[0004] The glycopeptides of the present invention are useful against many gram positive microorganisms, including vancomycin resistant enterococcus (VRE), methicillin resistant *Staphylococcus aureus* (MRSA), methicillin resistant *Staphylococcus epidermidis* (MRSE), and methicillin resistant coagulase negative Staphylococci (MR<sup>ENS</sup>). The antibacterial compounds of the present invention thus comprise an important new contribution to the development of therapeutic regimens for treating infections caused by these difficult to control pathogens and resistant strains.

[0005] There is an increasing need for agents effective against such pathogens, which are at the same time relatively free from undesirable side effects. What is more, the physicochemical and pharmacological characteristics of candidate drugs, including their solubility, charge, hygroscopic characteristics, lipophilicity, bioavailability, tissue distribution, serum half-life and the like can play important roles in determining the success or failure of a candidate drug in the clinic.

[0006] It should be noted that antibiotics of the type that includes vancomycin are typically administered parenterally, that is intravenously. Hence, a relatively high clearance rate would not typically be a disadvantage, and as stated above, would be of potential great benefit to certain patients. Such intravenous formulations impose certain requirements on a drug, not the least of which is adequate solubility in the formulation medium. Thus, poorly soluble drugs may be unsuitable as a practical matter because the clinician is unable to dissolve the drug in a formulation, much less deliver adequate amounts of the drug via intravenous drip. Generally, the pH of the formulation is buffered to correspond to physiological pH, which is about 7.4. VA-dle some

leeway is possible in the pH of an intravenous formulation, pain at the site of injection typically limits the useful range of pH to no less than about 5 to no greater than about 8. Preferably, the pH of an intravenous formulation ranges from about 6-8, more preferably from about 7-8 and most preferably at or about physiological pH (e.g., about 7.2-7.6).

[0007] Hence, there has been an on-going search for compounds that exhibit not only increased potency against resistant strains but also the physicochemical and pharmacological characteristics that enhance the effectiveness of a candidate compound and which may determine ultimately its acceptance in the clinic and resulting commercial success.

### SUMMARY OF THE INVENTION

[0008] The present invention provides new analogs of vancomycin, which exhibit enhanced biological activity and improved physicochemical and pharmacological characteristics. The overall properties of these analogs inform of their potential as drug candidates for treating infections caused by certain pathogens, including various strains of drug resistant bacteria. Accordingly, a general method is provided for the preparation of such compounds, along with methods of using them for the treatment of vertebrate conditions, including those afflicting mammals and especially those suffered by humans. Such conditions typically, although not exclusively, involve infections and other pathological conditions caused by bacteria and other microorganisms.

[0009] In particular, it has been observed that certain substituents positioned at the amine nitrogen of vancosamine and at the C-6 position of the glucose of vancomycin alternatively with other substitution, provide enhanced biological activity and give rise to desirable physicochemical and pharmacological characteristics, all of which improve a candidate drug's chances of success beyond the lab bench and in the clinic. More particularly, the present invention provides for certain substituents on the amine nitrogen of vancosamine, combined with substitution of a polar group at the C<sub>6</sub> position.

[0010] A wide range of possible polar substituents can be positioned at the glucose C-6 position of vancomycin. Polar substituents are substituents that bear a charge or possess the capacity to bear a charge, either positive or negative, at some useful range of pH, but preferably at or about physiological pH, enhance biological activity and/or provide advantageous physicochemical and/or pharmacological characteristics. Most preferably, the polar substituent is part of an N-substituent (that is, an amine or amine based substituent) at the C-6 position, including but not limited to a free amine, substituted amines, alpha-amino acid amides, carboxylic acid amides (e.g., the carboxylic acid amide obtained from the reaction of a C-6 amine with for example succinic acid, other diacids, anhydrides, or other bifunctional acids), quaternary ammonium salts and the like.

[0011] The compounds of the invention, including their pharmaceutically acceptable salts, are represented by the general Formula, presented below:

[0012]  $R^1$  is  $XR^a$ ; wherein X is absent or  $XR^a$  is

[0013]  $-\text{SO}_2R^a$ ,  $-\text{SO}_2N^aR^a$ ,  $-\text{COOR}^a$ ,  $-\text{CONR}^aR^a$ ,  $-\text{COR}^a$  when  $R^a$  is not hydrogen;

[0014] Each  $R^a$  is independently hydrogen, alkyl, aryl, heteroaryl, substituted alkyl, substituted aryl, substituted heteroaryl; wherein

[0015] (i) each of the substituents on substituted alkyl is independently

[0016] (a) halogen,

[0017] (b) cyano,

[0018] (c)  $\text{OR}^b$

[0019] (d)  $\text{NR}^bR^c$

[0020] (e)  $\text{COOR}^b$

[0021] (f)  $\text{CONR}^bR^c$ ,

[0022] (g)  $\text{SR}^b$

[0023] (h)  $-\text{SO}_2R^b$

[0024] (i)  $\text{SO}_2\text{NR}^bR^c$

[0025] (j) aryl,

[0026] (k) aryl substituted with one or more substituents independently selected from halogen, cyano,  $\text{OR}^b$ ,  $\text{SR}^b$ ,  $\text{COOR}^b$ ,  $\text{CONR}^bR^c$ ,  $\text{NR}^bR^c$ ,  $\text{SO}_2R^b$ ,  $\text{SO}_2\text{NR}^bR^c$ , alkyl, alkyl substituted with  $R^b$ , fluorinated alkyl, alkenyl, alkenyl substituted with  $R^b$ , alkynyl, alkynyl substituted with  $R^b$ , aryl, aryl substituted with  $R^b$ , heteroaryl, and heteroaryl substituted with  $R^b$ ;

[0027] (l) heterocycle, or

[0028] (m) heteroaryl substituted with one or more substituents independently selected from halogen, cyano,  $\text{OR}^b$ ,  $\text{SR}^b$ ,  $\text{COOR}^b$ ,  $\text{CONR}^bR^c$ ,  $\text{NR}^bR^c$ ,

$\text{SO}_2R^b$ ,  $\text{SO}_2\text{NR}^bR^c$ , alkyl, alkyl substituted with  $R^b$ , fluorinated alkyl, alkenyl, alkenyl substituted with  $R^b$ , alkynyl, alkynyl substituted with  $R^b$ , aryl, aryl substituted with  $R^b$ , heteroaryl, and heteroaryl substituted with  $R^b$ ;

[0029] (ii) each of the substituents on substituted aryl is independently

[0030] (a) halogen,

[0031] (b) cyano,

[0032] (c)  $\text{OR}^b$

[0033] (d)  $\text{NR}^bR^c$

[0034] (e)  $\text{COOR}^b$

[0035] (f)  $\text{CONR}^bR^c$ ,

[0036] (g)  $\text{SR}^b$

[0037] (h)  $\text{SO}_2R^b$

[0038] (i)  $\text{SO}_2\text{NR}^bR^c$

[0039] (j) aryl,

[0040] (k) aryl substituted with one or more substituents independently selected from halogen, cyano,  $\text{OR}^b$ ,  $\text{SR}^b$ ,  $\text{COOR}^b$ ,  $\text{CONR}^bR^c$ ,  $\text{NR}^bR^c$ ,  $\text{SO}_2R^b$ ,  $\text{SO}_2\text{NR}^bR^c$ , alkyl, alkyl substituted with  $R^b$ , fluorinated alkyl, alkenyl, alkenyl substituted with  $R^b$ , alkynyl, alkynyl substituted with  $R^b$ , aryl, aryl substituted with  $R^b$ , heteroaryl, and heteroaryl substituted with  $R^b$ ;

[0041] (l) heterocycle, or

[0042] (m) heteroaryl substituted with one or more substituents independently selected from halogen, cyano,  $\text{OR}^b$ ,  $\text{SR}^b$ ,  $\text{COOR}^b$ ,  $\text{CONR}^bR^c$ ,  $\text{NR}^bR^c$ ,  $\text{SO}_2R^b$ ,  $\text{SO}_2\text{NR}^bR^c$ , alkyl, alkyl substituted with  $R^b$ , fluorinated alkyl, alkenyl, alkenyl substituted with  $R^b$ , alkynyl, alkynyl substituted with  $R^b$ , aryl, aryl substituted with  $R^b$ , heteroaryl, and heteroaryl substituted with  $R^b$ ;

[0043] (n) alkyl,

[0044] (o) alkyl substituted with  $R^b$ ;

[0045] (p) alkenyl,

[0046] (q) alkenyl substituted with  $R^b$ ;

[0047] (r) alkynyl,

[0048] (s) alkynyl substituted with  $R^b$ ;

[0049] (iii) each of the substituents on substituted heteroaryl is independently

[0050] (a) halogen,

[0051] (b) cyano,

[0052] (c)  $\text{OR}^b$

[0053] (d)  $\text{NR}^bR^c$

[0054] (e)  $\text{COOR}^b$

[0055] (f)  $\text{CONR}^bR^c$ ,

[0056] (g)  $\text{SR}^b$

[0057] (h)  $\text{SO}_2R^b$

[0058] (j) aryl,

- [0059] (k) aryl substituted with one or more substituents independently selected from halogen, cyano, OR<sup>b</sup>, SR<sup>b</sup>, COOR<sup>b</sup>CONR<sup>b</sup>R<sup>c</sup>, NR<sup>b</sup>R<sup>c</sup>, SO<sub>2</sub>R<sup>b</sup>, SO<sub>2</sub>NR<sup>b</sup>R<sup>c</sup>, alkyl, alkyl substituted with R<sup>b</sup>, fluorinated alkyl, alkenyl, alkenyl substituted with R<sup>b</sup>, alkynyl, alkynyl substituted with R<sup>b</sup>, aryl, aryl substituted with R<sup>b</sup>, heteroaryl, heteroaryl substituted with R<sup>b</sup>;
- [0060] (l) heterocycle, or
- [0061] (m) heteroaryl substituted with one or more substituents independently selected from halogen, cyano, OR<sup>b</sup>, SR<sup>b</sup>, COOR<sup>b</sup>CONR<sup>b</sup>R<sup>c</sup>, NR<sup>b</sup>R<sup>c</sup>, SO<sub>2</sub>R<sup>b</sup>, SO<sub>2</sub>NR<sup>b</sup>R<sup>c</sup>, alkyl, alkyl substituted with R<sup>b</sup>, fluorinated alkyl, alkenyl, alkenyl substituted with R<sup>b</sup>, alkynyl, alkynyl substituted with R<sup>b</sup>, aryl, aryl substituted with R<sup>b</sup>, heteroaryl, and heteroaryl substituted with R<sup>b</sup>;
- [0062] (n) alkyl,
- [0063] (o) alkyl substituted with R<sup>b</sup>;
- [0064] (p) alkenyl,
- [0065] (q) alkenyl substituted with R<sup>b</sup>;
- [0066] (r) alkynyl,
- [0067] (s) alkynyl substituted with R<sup>b</sup>;
- [0068] or R<sup>a</sup> and R<sup>a</sup> together with the nitrogen to which they are attached form C<sub>3</sub>-C<sub>6</sub> heterocycloalkyl consisting of from 2 to 5 carbons atoms and from 1 or 2 nitrogen, oxygen, and sulfur atoms. The heterocycloalkyl may be substituted with alkyl, aryl, heteroaryl, OR<sup>b</sup>, NR<sup>b</sup>R<sup>c</sup>, COOR<sup>b</sup>, CONR<sup>b</sup>R<sup>c</sup>, substituted alkyl, substituted aryl, or substituted heteroaryl as defined above;
- [0069] R<sup>b</sup> and R<sup>c</sup> are each independently hydrogen, alkyl, aryl, heteroaryl, substituted alkyl substituted with 1 to 3 groups of R<sup>x</sup>, substituted aryl substituted with 1 to 3 groups of R<sup>y</sup>, or substituted heteroaryl substituted with 1 to 3 groups of R<sup>z</sup>; wherein
- [0070] (i) wherein Rx represents:
- [0071] (a) halogen,
- [0072] (b) cyano,
- [0073] (c) OH, O-alkyl
- [0074] (d) N(alkyl)<sub>2</sub>, NH-alkyl
- [0075] (e) COOH, COO-alkyl
- [0076] (f) CON(alkyl)<sub>2</sub>, CONH-alkyl,
- [0077] (g) SO<sub>2</sub>N(alkyl)<sub>2</sub>, SO<sub>2</sub>NH-alkyl,
- [0078] (h) aryl,
- [0079] (i) aryl substituted with one or more substituents independently selected from halogen, cyano, hydroxy, O-alkyl, alkyl, fluorinated alkyl, COOH, COO-alkyl, CONH-alkyl, CON(alkyl)<sub>2</sub>, and N(alkyl)<sub>2</sub>;
- [0080] (j) heterocycle, or
- [0081] (k) heterocycle substituted with one or more substituents independently selected from halogen, cyano, hydroxy, O-alkyl, alkyl, fluorinated alkyl, COOH, COO-alkyl, CONH-alkyl, CON(alkyl)<sub>2</sub>, and N(alkyl)<sub>2</sub>;
- [0082] (ii) R<sup>y</sup> represents:
- [0083] (a) halogen,
- [0084] (b) cyano,
- [0085] (c) OH, O-alkyl
- [0086] (d) N(alkyl)<sub>2</sub>, NH-alkyl
- [0087] (e) COOH, COO-alkyl
- [0088] (f) CON(alkyl)<sub>2</sub>, CONH-alkyl,
- [0089] (g) SO<sub>2</sub>N(alkyl)<sub>2</sub>, SO<sub>2</sub>NH-alkyl
- [0090] (h) aryl,
- [0091] (i) aryl substituted with one or more substituents independently selected from halogen, cyano, hydroxy, O-alkyl, alkyl, fluorinated alkyl, COOH, COO-alkyl, CONH-alkyl, CON(alkyl)<sub>2</sub>, and N(alkyl)<sub>2</sub>;
- [0092] (j) heterocycle, or
- [0093] (k) heterocycle substituted with one or more substituents independently selected from halogen, cyano, hydroxy, O-alkyl, alkyl, fluorinated alkyl, COOH, COO-alkyl, CONH-alkyl, CON(alkyl)<sub>2</sub>, and N(alkyl)<sub>2</sub>;
- [0094] (iii) where RZ represents:
- [0095] (a) halogen,
- [0096] (b) cyano,
- [0097] (c) OH, O-alkyl
- [0098] (d) N(alkyl)<sub>2</sub>, NH-alkyl
- [0099] (e) COOH, COO-alkyl
- [0100] (f) CON(alkyl)<sub>2</sub>, CONH-alkyl,
- [0101] (g) SO<sub>2</sub>N(alkyl)<sub>2</sub>, SO<sub>2</sub>NH-alkyl
- [0102] (h) aryl,
- [0103] (i) aryl substituted with one or more substituents independently selected from halogen, cyano, hydroxy, O-alkyl, alkyl, fluorinated alkyl, COOH, COO-alkyl, CONH-alkyl, CON(alkyl)<sub>2</sub>, and N(alkyl)<sub>2</sub>;
- [0104] (j) heterocycle, or
- [0105] (k) heterocycle substituted with one or more substituents independently selected from halogen, cyano, hydroxy, O-alkyl, alkyl, fluorinated alkyl, COOH, COO-alkyl, CONH-alkyl, CON(alkyl)<sub>2</sub>, and N(alkyl)<sub>2</sub>;
- [0106] or R<sup>b</sup> and R<sup>c</sup> together with the nitrogen to which they are attached form C<sub>3</sub>-C<sub>6</sub> heterocycloalkyl consisting of from 2 to 5 carbons atoms and from 1 to 2 nitrogen, oxygen, and sulfur atoms. The heterocycloalkyl may be substituted with alkyl, aryl, heteroaryl, O-alkyl, NHalkyl, COOH, COO-alkyl, CONH-alkyl, CON(alkyl)<sub>2</sub>, SO<sub>2</sub>N(alkyl)<sub>2</sub>, SO<sub>2</sub>NH-alkyl, substituted alkyl, substituted aryl, or substituted heteroaryl as previously defined in R<sup>x</sup>, R<sup>y</sup> and R<sup>z</sup>, respectively, above;

[0107]  $R^2$  is  $NR^aR^a$ ,  $SR^a$ ,

[0108] and  $OR^a$  wherein  $OR^a$  is not OH;

[0109]  $R^3$  is  $CONR^aR^a$  or  $COOR^a$  wherein  $COOR^a$  is not  $COOH$  and  $R^a$  does not contain as a sub-structure a generally recognized antibacterial agent.

[0110] Preferred compounds are those wherein  $R^1$  is unsubstituted or substituted benzyloxybenzyl, preferably substituted with one or more halogens such as chlorine or unsubstituted or substituted biphenylbenzyl;  $R^2$  is  $HN_2$ , or substituted amino such as hydroxy alkylamino, phenylalkylamino, or a heterocyclic group such as morpholino or piperidino and  $R^3$  is morpholinylamido, hydroxyalkoxyalkoxyalkyleneamido, aminoalkyleneamido, or azidoalkoxyalkoxyalkoxyalkyleneamido.

[0111] The invention is also directed to pharmaceutical compositions, including enteral and parenteral formulations of the compounds disclosed herein. Also disclosed are methods of determining the biological activities of the various compounds of interest to the invention, as well as those of lesser interest. Methods of preparing the compounds and of utilizing same in a treatment regimen are also described and contemplated.

[0112] A more detailed description of the preferred embodiments of the invention follows for the benefit of the reader. Additional objects of the invention will become apparent to the reader after consideration of the entire disclosure.

#### DETAILED DESCRIPTION OF THE INVENTION

[0113] As stated above, it has been observed that the vancomycin analogs of this invention possess enhanced biological activity relative to those conventional substituents that do not fall within the scope of the invention. These vancomycin analogs consistently exhibit an increase in activity over those vancomycin analogs bearing conventional substituents.

[0114] The term "alkyl" refers to a monovalent alkane (hydrocarbon) derived radical comprising 1 to about 20 carbon atoms connected by single or multiple bonds, unless otherwise indicated. The alkyl group may be straight, branched, or cyclic. Examples of alkyl groups include, but are not limited to, methyl, ethyl, propyl, isopropyl, butyl, secbutyl, t-butyl, pentyl, cyclopentyl, hexyl and cyclohexyl. The term "alkylene" refers to a hydrocarbon radical comprising 1 to about 20 carbon atoms connected by single or multiple bonds, unless otherwise indicated, and which is bound to other functional or chemical groups of the molecule at least at two sites. Examples of alkylene groups include, but are not limited to,  $-\text{CH}_2-$ ,  $-\text{CH}_2\text{CH}_2-$ ,  $\text{CH}_2\text{CH}_2\text{CH}_2-\text{CH}_2$  ( $\text{CH}_3\text{CH}_2-$ ), and the like, wherein each dash represents a point of attachment to another chemical or functional group of the molecule. When substituted, alkyl and alkylene groups may be substituted with substituent groups at any available point of attachment. When an alkyl group is described as being substituted with an alkyl group, such a phrase is used interchangeably with "branched alkyl group."

[0115] The term "cycloalkyl" is a species of alkyl and is a group comprising about 3 to about 15 carbon atoms, without alternating or resonating double bonds between carbon atoms. It may also contain from 1 to 4 fused rings.

[0116] The term "aryl" refers to a group derived from a non-heterocyclic aromatic group having from six to about twenty carbon atoms and from one to four rings, which may be fused, connected by single bonds, or both. An aryl group may be substituted by one or more of alkyl, aralkyl, heterocyclic, heterocyclicalkyl, heterocycliccarbonyl, halo, hydroxyl, protected hydroxyl, amino, nitro, cyano, alkoxy, aryloxy, aralkyloxy, aroyloxy, alkylamino, dialkylamino, trialkylammonium, alkylthio, alkanoyl, alkanoyloxy, alkanoylamido, alkylsulfonyl, arylsulfonyl, aroyl, aralkanoyl, alkylloxycarbonyl, aralkylloxycarbonyl, aminocarbonyl, alkylaminocarbonyl, dialkylaminocarbonyl and the like.

[0117] The term "aralkyl" refers to an alkyl group bearing an aryl group substituent.

[0118] The terms "heterocyclic", "heterocycle", or "heteroaryl" refers to a cyclic hydrocarbon group in which at least one of the ring positions is occupied by a heteroatom. A heterocyclic compound may have from one to about four rings, which may be fused, connected by single bonds, or both. A heterocyclic group may comprise from three to about twenty ring atoms, which atoms may be chosen from carbon, nitrogen, oxygen, or sulfur as long as at least one heteroatom is present. A heterocyclic group may have up to 1, 2, or 3 double bonds per ring, thus allowing for an aromatic system. A heterocyclic group may be substituted by one or more of alkyl, aryl, aralkyl, halo, hydroxyl, protected hydroxyl, amino, nitro, cyano, alkoxy, aryloxy, aralkyloxy, aroyloxy, alkylamino, dialkylamino, trialkylammonium, alkylthio, alkanoyl, alkanoyloxy, alkanoylamido, alkylsulfonyl, arylsulfonyl, aroyl, aralkanoyl, alkylloxycarbonyl, aralkylloxycarbonyl, aminocarbonyl, alkylaminocarbonyl, dialkylaminocarbonyl and the like.

[0119] The term "alkenyl" refers to a monovalent alkene group comprising up to about 20 carbon atoms which contains at least one double bond between carbon atoms. The alkene group may be straight chained or branch chained. Examples include vinyl, propenyl, butenyl and pentenyl groups.

[0120] The term "alkynyl" refers to a monovalent alkyne group comprising up to about 20 carbon atoms which contains at least one triple bond between carbon atoms. The alkyne group may be straight or branch chained. Examples are propynyl, butynyl and pentynyl.

[0121] A generally recognized antibacterial agent referred to above as a sub-structure means any antibacterial agent whose structure is known in the art and is defined in the Merck Index.

[0122] The term "heteroatom" means an atom other than carbon or hydrogen, but is generally associated with the atoms N, O, or S, selected on an independent basis.

[0123] The term "halogen" or "halo" refer to fluorine, chlorine, bromine, or iodine.

[0124] The terms "alkoxy", "aryloxy" and "aralkyloxy" refer to a chemical group in which an oxygen atom is covalently bound to an alkyl, aryl, or aralkyl group, respectively.

[0125] The terms "alkanoyl", "aroyl" and "aralkanoyl" refer to chemical groups in which a carbonyl group is covalently bound to an alkyl, aryl, or aralkyl group, respectively.

[0126] The term "heterocyclicalkyl" or "heterocycliccarbonyl" refers to chemical groups in which a heterocyclic group is covalently bound to an alkyl or carbonyl group, respectively.

[0127] When a group is termed "substituted," unless otherwise indicated, this means that the group contains from 1 to the number of substituents which can be substituted on the group.

[0128] When a functional group is termed "protected," this means that the group is in a temporary, modified form to inhibit the participation of the protected site in a particular reaction sequence intended to effect some change elsewhere in the molecule. Suitable protecting groups for the compounds of the present invention will be recognized from the present application taking into account the level of skill in the art, and with reference to standard textbooks, such as Greene, T. W. et al. "Protective Groups in Organic Synthesis" Wiley, New York (1991). In addition, examples of suitable protecting groups are presented throughout the specification.

[0129] In some of the glycopeptide compounds of the present invention a hydroxyl-protect group might be required. Such conventional protecting groups consist of known groups, which are used to protectively block the hydroxyl group during the synthetic procedures described herein. These conventional blocking groups are readily removable; i.e., they can be removed, if desired, by procedures that will not cause cleavage or other disruption of the remaining portions of the molecule. Such procedures include chemical and enzymatic hydrolysis, treatment with chemical reducing or oxidizing agents under mild conditions, treatment with a transition metal catalyst, a nucleophile and catalytic hydrogenation.

[0130] Examples of suitable C-6 hydroxyl protecting groups include, but are not limited to, triethylsilyl, t-butyldimethylsilyl, o-nitrobenzyloxycarbonyl, p-nitrobenzyloxycarbonyl, benzyloxycarbonyl, allyloxycarbonyl, t-butyloxycarbonyl, 2,2,2-trichloro ethyloxycarbonyl and the like.

[0131] The glycopeptide compounds of the present invention are useful per se and in their pharmaceutically acceptable salt and ester forms for the treatment of bacterial infections in animal and human subjects. The term "pharmaceutically acceptable ester, salt, or hydrate" refers to those esters, salts, or hydrated forms of the compounds of the present invention, which would be apparent to the medicinal chemist. Such forms include, but are not limited to, those that are substantially non-toxic and which may favorably affect the pharmacokinetic properties of said compounds, such as palatability, absorption, distribution, metabolism and excretion. Other factors, more practical in nature, which are also important in the selection, are cost of the raw materials, ease of crystallization, yield, stability, solubility, hygroscopicity and flowability of the resulting bulk drug. Conveniently, pharmaceutical compositions may be prepared from the active ingredients in combination with pharmaceutically acceptable carriers. Thus, the present invention is also concerned with pharmaceutical compositions and methods of treating bacterial infections utilizing as an active ingredient the novel glycopeptide compounds of the present invention, particularly the vancomycin-like glycopeptide compounds disclosed herein.

[0132] The pharmaceutically acceptable salts referred to above also include acid addition salts. Thus, the Formula I

compounds can be used in the form of salts derived from inorganic or organic acids. Included among such salts are the following: acetate, adipate, alginate, aspartate, benzoate, benzenesulfonate, bisulfate, butyrate, citrate, camphorate, camphorsulfonate, cyclopentanepropionate, digluconate, dodecylsulfate, ethanesulfonate, fumarate, glucoheptanoate, glycerophosphate, hemisulfate, heptanoate, hexanoate, hydrochloride, hydrobromide, hydroiodide, 2-hydroxyethanesulfonate, lactate, maleate, methanesulfonate, 2-naphthalenesulfonate, nicotinate, oxalate, pamoate, pectinate, persulfate, 3-phenylpropionate, picrate, pivalate, propionate, succinate, tartrate, thiocyanate, tosylate, undecanoate and the like.

[0133] Protection of amines by a similar group requires using excess acylation reagent while selective protection of the N-methyl leucine residue is known, allowing selective functionalization of the vancosamine amine group. See, Pavlov et al., J. Antibiotics, 1993, 46, 1731. Selectively, introducing the mesitylenesulfonyl group at the glucose-6-position differentiates this position from the other hydroxyl groups and allows further reaction to displace the mesitylenesulfonyl group, affording many derivatives. A variety of functional groups are introduced at the glucose-6 position by using common methods for nucleophilic displacement of primary arylsulfonyl groups directly, or by further synthetic modification of initial displacement products, including azido and iodo groups. For example, the iodo group is displaced by a variety of nucleophiles to produce additional C-6 derivatives. A preferred nucleophile is a thiol compound, especially a heterocyclic thiol. Modification of an azido group at the 6-position is performed, e.g., by reducing the azido group to an amino group, which in turn is functionalized by means of reductive alkylation, nucleophilic substitution, or other amino-group reactions well known to those skilled in the art. These approaches are illustrated in many examples. In a preferred embodiment of the invention, an azido group is partially reduced by reaction with a phosphine compound to produce an iminophosphorane.

[0134] The synthesis of the target compound is completed by removing any protecting groups that may be present in the penultimate intermediate using standard techniques that are well known to those skilled in the art. The deprotected final product is then purified, as necessary, using standard techniques such as ion exchange chromatography, reverse phase HPLC, MPLC on reverse phase polystyrene gel and the like, or by recrystallization.

[0135] The final product may be characterized structurally by standard techniques such as NMR, IR, MS and UV. For ease of handling, the final product, if not crystalline, may be lyophilized from water to afford an amorphous, easily handled solid.

[0136] In general, introduction of the R<sup>1</sup> group is preferably by reductive amination, either directed or to a peptide-protective species. In general, introduction of the R<sup>2</sup> group is preferably by azide displacement/reduction, amine nucleophilic displacement, and/or acylation.

[0137] More specifically, the amine substituents of vancomycin are protected while introducing a functional group such as mesitylenesulfonyl at the C<sub>6</sub> position. The allyloxy-carbonyl protective groups are introduced by reaction of a vancomycin hydrochloride in aqueous solution with N-(allyloxycarbonyloxy) succinimide contained in an organic solvent such as acetone. A preferred procedure is to treat the aqueous solution of vancomycin with the organic solvent solution of the succinimide.

[0138] The protected solid product is reacted with an alkyl halide reactant such as alkyl bromide in the presence of an alkali metal bicarbonate to form an alkyl ester of the carboxyl and protect that position. The resulting alkyl ester is then reacted with a compound which will introduce a functional group such as mesitylenesulfonyl chloride in a solvent such as pyridine so as to introduce the mesitylenesulfonyl moiety at the C<sub>6</sub> hydroxy. This compound is then reacted with an alkali metal halide such as KI to introduce I at the C<sub>6</sub> position. The protective alkyl groups is then removed conventionally such as with palladium compound and a phosphinobutane.

[0139] This intermediate can be reacted with allyloxycarbonyl succinimide to protect the secondary nitrogen while leaving the primary nitrogen unprotected. This intermediate can be reacted with an aldehyde such as benzyloxyaldehyde to introduce a benzyloxy benzyl group at the vancosamine nitrogen. Similarly, other aldehydes can be reacted with the same or similar intermediates to form other derivatives such as R<sub>1</sub>CHO aldehydes.

[0140] After the vancosamine is suitably substituted, the intermediate is reacted with an alkali azide to form an azide which is then reacted with a phosphine for conversion to the amine. Obviously substituted amines such as the substituents shown in this position can be provided using these reactions. After the vancosamine amine polar group is introduced, the protected secondary amine is deprotected to produce the final product.

[0141] The compounds of the present invention are valuable antibacterial agents active against various gram-positive and, to a lesser extent, gram-negative bacteria. Accordingly, these compounds find utility in human and veterinary medicine.

[0142] Many of compounds of the present invention are biologically active against VRE/MRSA/MRCNS. In vitro antibacterial activity is generally predictive of in vivo activity. It is contemplated that the compounds of the present invention will be administered to a mammal infected with a susceptible bacterial organism.

[0143] Using standard susceptibility tests, the compounds of the invention are determined to be active against VRE/MRSA.

[0144] The compounds of the invention can be formulated in pharmaceutical compositions by combining the compound with a pharmaceutically acceptable carrier. Examples of such carriers are set forth below.

[0145] The compounds may be employed in powder or crystalline form, in liquid solution, or in suspension. They may be administered by a variety of means; those of principal interest include: topically, orally and parenterally by injection (intravenously or intramuscularly).

[0146] Compositions for injection, a preferred route of delivery, may be prepared in unit dosage form in ampoules, or in multidose containers. The injectable compositions may take such forms as suspensions, solutions, or emulsions in oily or aqueous vehicles, and may contain various formulating agents. Alternatively, the active ingredient may be in powder (lyophilized or non-lyophilized) form for reconstitution at the time of delivery with a suitable vehicle, such as sterile water. In injectable compositions, the carrier is typically comprised of sterile water, saline, or another injectable liquid, e.g., peanut oil for intramuscular injections. Also, various buffering agents, preservatives and the like can be included.

[0147] Topical applications may be formulated in carriers such as hydrophobic or hydrophilic base formulations to provide ointments, creams, lotions, in aqueous, oleaginous, or alcoholic liquids to form paints or in dry diluents to form powders.

[0148] Oral compositions may take such forms as tablets, capsules, oral suspensions and oral solutions. The oral compositions may utilize carriers such as conventional formulating agents and may include sustained release properties as well as rapid delivery forms.

[0149] The dosage to be administered depends to a large extent upon the condition and size of the subject being treated, the route and frequency of administration, the sensitivity of the pathogen to the particular compound selected, the virulence of the infection and other factors. Such matters, however, are left to the routine discretion of the physician according to principles of treatment well known in the antibacterial arts. Another factor influencing the precise dosage regimen, apart from the nature of the infection and peculiar identity of the individual being treated, is the molecular weight of the compound.

[0150] The compositions for human delivery per unit dosage, whether liquid or solid, may contain from about 0.01% to as high as about 99% of active material, the preferred range being from about 10-60%. The composition will generally contain from about 15 mg to about 2.5 g of the active ingredient; however, in general, it is preferable to employ dosage amounts in the range of from about 250 mg to 1000 mg. In parenteral administration, the unit dosage will typically include the pure compound in sterile water solution or in the form of a soluble powder intended for solution, which can be adjusted to neutral pH and be made isotonic.

[0151] The invention described herein also includes a method of treating a bacterial infection in a mammal in need of such treatment comprising administering to said mammal a compound of the invention in an amount effective to treat said infection.

[0152] The preferred methods of administration of the antibacterial compounds of the invention include oral and parenteral, e.g., i.v. infusion, i.v. bolus and i.m. injection.

[0153] These compounds exhibit desirable levels of antibiotic activity when tested against a panel of bacterial strains, including certain vancomycin-resistant strains, as described in greater detail, below. The compounds of the invention consistently provide an increase in activity to vancomycin and teicoplanin.

[0154] In Vitro Assay Utilizing a Panel of Bacterial Strains

[0155] Assay Protocol

[0156] National Committee for Clinical Laboratory Standards (NCCLS) guidelines [Methods for Dilution Antimicrobial Susceptibility Tests for Bacteria that Grow Aerobically—Fourth Edition; Approved Standard (NCCLS Document M7-A4, January 1997)] are used to establish the assay, although variations are made to optimize the published method according to the specific needs of the present investigation.

[0157] The test panel currently includes eight enterococci and 13 staphylococci, which are selected based upon their antibiotic susceptibility profiles. The methicillin-sensitive *Staphylococcus aureus* (MSSA) strain MB2985 (Smith isolate) is used to assesses the potential for serum protein

binding of the compounds. The paired Gram-negative strains ASP #49 (envA-) and ASP #50 (envA+) (M. Salvatore/N. Lee) are included to judge membrane effects. Table 1 presents a detailed description of the strains included in the panel, including some of the sources of the strains of bacteria.

[0158] Relevant antibiotic controls include the glycopeptide antibiotic vancomycin and the penem antibiotic Schering 29482, which exhibits reduced activity in the presence of Human Serum Albumin or Fraction V, due to binding of the antibiotic. The glycopeptide antibiotic teicoplanin is included whenever possible.

#### [0159] Recommended Sources of Supplies

[0160] Trypticase Soy Broth (TSB) (Source: BBL, Becton Dickinson Microbiology Systems, Cockeysville, Md. 21030, U.S. A.)

[0161] Horse Serum (HS) (Source: GIBCO BRL Laboratories, Grand Island, N.Y. 14072, U.S. A.)

[0162] Mueller Hinton II Broth (MH II) (Source: BBL, Becton Dickinson Microbiology Systems, Cockeysville, Md. 21030, U.S. A.)

[0163] Brain Heart Infusion Broth (BHI) and Brain Heart Infusion Agar (BHI Agar) (Source: Difco Laboratories, Detroit, Mich. 48232, U.S. A.)

[0164] Human Serum Albumin, Fraction V (HSA) (Source: Calbiochem Corporation, La Jolla, Calif. 92037, U.S. A.)

#### [0165] Overnight Growth Medium

[0166] TSB, containing 10% HS\* for vancomycin intermediate *S. aureus*/methicillin-resistant *S. aureus* (VISA/MRSA) strains, is inoculated from an appropriate source (frozen broth or agar slant) and grown approximately 17 hr at 35° C. with shaking at 220 rpm. Cultures are grown in tubes with a volume of 5 ml for enterococci and 2 ml for all other strains.

[0167] \* HS is aseptically added to TSB on top of normal volume of medium at time of use: 0.5 mL HS+5 mL TSB fi TSB+10% HS

#### [0168] Culture Dilution

[0169] Four milliliter (4 ml) overnight culture is added to 36 ml physiological saline to obtain tenfold dilutions (enterococci). Overnight culture (0.4 ml) is added to 39.6 ml saline to obtain 100-fold dilutions (all strains except enterococci). Diluted cultures are maintained on ice until time of inoculation of test plates.

#### [0170] Plate Medium for Obtaining Titers of Overnight Cultures

[0171] The number of CFU/ml is determined on BHI agar plates, although this is not done routinely because titers of overnight cultures are relatively constant. The test media include:

[0172] BHI for enterococci and VISA/MRSA;

[0173] MH II (i.e., cation-adjusted Mueller-Hinton broth) for MRS, MSS and *E. coli*;

[0174] MHII+HSA for MSSA is prepared as follows:

[0175] a. 2x MH II+86 mg/ml HSA

[0176] b. Dissolve 4.3 g HSA in 50 ml autoclaved 2x MH II.

[0177] c. pH to 7.0 by adding 2M MOPS, sodium.

[0178] d. Filter sterilize using 0.22  $\mu$ m Coming cellulose acetate filter, used because of reported low protein binding.

[0179] e. 1x MH II+43 mg/ml HSA

[0180] f. Dilute the 2x medium twofold and filter as above.

#### [0181] Preparation of Test Plates

[0182] Using a Denley liquid handling system (or similar automatic device), 100  $\mu$ L medium is added to each well in columns 2-12 of a 96-well microtiter dish. Using a multi-channel pipettor, 100  $\mu$ L 2x medium is added to each well in column 1. Plates may be filled on the day prior to assay, wrapped in plastic bags and refrigerated.

#### [0183] Preparation of Antibiotics

[0184] Vancomycin, Schering 29482, and teicoplanin are prepared on a weight per volume basis using 10 mM 3-(N-morpholino)propane-sulfonic acid (MOPS) buffer pH 7. Test compounds are received in solution in appropriate solvent (typically as 1 mg/ml in DMSO) or are dissolved in appropriate solvent prior to further dilution in 10 mM MOPS buffer, pH7. Consistent with NCCLS guidelines, antibiotics are handled aseptically but are not otherwise sterilized.

#### [0185] Assay

[0186] 100  $\mu$ L appropriately diluted antibiotic solution is added to the first well of the designated row of the 96-well microtiter dish and serially diluted by twofold across the row using the Denley liquid handling system. With the aid of a Dynatech NEC<sub>2000</sub> inoculator, each well of the microtiter dish is inoculated with 1.5  $\mu$ L diluted overnight culture, yielding approximately 1-5x10<sup>6</sup> CFU/ml for enterococci and approximately 3-7x10<sup>5</sup> CFU/ml for all other strains. Dishes are placed in stacks of no more than five, wrapped in plastic bags and incubated at 35° C.

[0187] Indication of result(s) type (%INH, IC<sub>50</sub>, Zone size, etc.)

[0188] MIC=minimum inhibitory concentration

[0189] Interpretation of the Results on the Basis of Activity

[0190] Presence or absence of growth is scored at 18-20 hours for strain MB2985 and for *E. coli*, at 22-24 hr for all other strains. MIC is defined as the lowest concentration of antibiotic that allows no visible growth following incubation. The compounds of the present invention display adequate improvement over the activity exhibited by the control compounds.

[0191] In Vivo Mice Studies Protocol for the Methicillin-sensitive *Staphylococcus aureus* Septicemia

[0192] Selected compounds of the invention are tested in an in vivo mouse model. Single dose subcutaneous antibiotic protection from septicemic infections is measured as described by Gill, C. J., J. J. Jackson, L. Gercikens, B. Pelak, R. Thompson, J. Sundelof, H. Kropp and H. Rosen. Antimicrob. Agents Chemother. 42:1996-2001 (1998). Survival is monitored for seven days. ED<sub>50</sub>'s and LD<sub>50</sub>'s are determined by the method of Knudsen and Curtis. J. Am. Stat.

Assoc. 42:282-296 (1947). Septicemia is induced in 20 gram ICR (derived from CD-1) female mice by intraperitoneal infection with *Staphylococcus aureus* strain MB2985. Infection is given i.p. in Brain Heart Broth (BHB) at an infectious inoculum of  $1.8 \times 10^7$  cfu/mouse. Drug is administered subcutaneously immediately after the infection is initiated.

[0193] The MIC is determined by microdilution in Mueller-Hinton broth (MHB) according to the National Committee for Clinical Laboratory Standards guidelines after incubation for 24 hours. Enterococci are tested in cation-supplemented Mueller-Hinton broth at  $1.4 \times 10^5$  cfu/ml. MIC is defined as the lowest concentration of antibiotic, which inhibits visible growth.

[0195] The following examples are presented to illustrate the invention but it is not considered to be limited thereto. Parts are by weight unless otherwise indicated.

[0196] HPLC Conditions for Examples 1-19:

[0197] Analytical HPLC:

[0198] Instrument: Hewlett Packard 1090 Liquid Chromatograph

[0199] Column: YMC Combiscreen ODS-A, 50x4.6 mm

## EXAMPLE 1

[0207] Morpholinylamido-N-4-(3,4-dichlorobenzoyloxy)-benzyl-glucose-6-deoxy-6-aminovancomycin

-continued

Step A

[0208] N'-allyloxycarbonyl-glucose-6-deoxy-6-iodovancomycin

[0209] To a stirring solution of glucose-6-deoxy-6-iodovancomycin (1.0 mmol, 1.56 g) and  $\text{NaHCO}_3$  (4 mmol, 336 mg) in 40 mL of 1:1 dioxane/ $\text{H}_2\text{O}$  cooled in an ice bath was added dropwise a solution of N-(allyloxycarbonyloxy)succinimide (1.0 mmol, 199 mg) in 4 mL of dioxane. The reaction was stirred at  $4^\circ$  for 65 h. 20 mL of isopropanol was added to the reaction mixture, and the solvent removed by rotary evaporation. The solid residue was triturated in  $\text{CH}_2\text{Cl}_2$ , filtered and dried under high vacuum affording 1.85 g of crude solid. HPLC retention time=1.24 min.

Step B

[0210] N-4-(3,4-dichlorobenzoyloxy)benzyl-N'-allyloxy-carbonyl-glucose-6-deoxy-6-iodovancomycin

[0211] A solution of the product from Step A (0.5 mmol, 767 mg) and 4-(3,4-dichlorobenzoyloxy)benzaldehyde (1.5 mmol, 422 mg) was heated at 50 in 20 mL of DMF containing 2% (v/v) of HOAc for 2 h. Solid NaBH<sub>3</sub>CN (3.5 mmol, 220 mg) was added to the solution, which was heated at 50° for 18 h. The product was precipitated by addition of 150 mL of Et<sub>2</sub>O. The solid was filtered, washed with Et<sub>2</sub>O and CH<sub>2</sub>Cl<sub>2</sub> and dried in vacuo, affording 773 mg of solid. HPLC retention time=1.98 min.

Step C

[0212] N-4-(3,4-dichlorobenzoyloxy)benzyl-glucose-6-deoxy-6-iodo-vancomycin

[0213] To the product from Step B (0.42 mmol, 760 mg) in 11 mL of 10:1 DMF/piperidine was added a 3 mL solution of Pd<sub>2</sub>dba<sub>3</sub> (0.01 mmol, 10 mg) and 1,4-bis-(diphenylphosphino)butane (0.025 mmol, 11 mg) in THF under nitrogen atmosphere. After 30 min. the product was precipitated by addition of 30 mL of Et<sub>2</sub>O. The solid was filtered, washed

with Et<sub>2</sub>O and CH<sub>2</sub>Cl<sub>2</sub> and dried in vacuo, affording 741 mg of slightly greenish solid. HPLC retention time=1.46 min.

Step D

[0214] N-4-(3,4-dichlorobenzoyloxy)benzyl-N'-allyloxy-carbonyl-glucose-6-deoxy-6-amino-vancomycin

[0215] A slurry of the product from Step C (0.27 mmol, 500 mg) and NaN<sub>3</sub> (3 mmol, 200 mg) were stirred in 7 mL of DMF at 60° for 18 h. The reaction was allowed to reach ambient temperature, and the solution was filtered to remove solid NaN<sub>3</sub>. The product was precipitated by addition of 50 mL of Et<sub>2</sub>O to the filtrate. The solid was filtered, washed with Et<sub>2</sub>O and CH<sub>2</sub>Cl<sub>2</sub> and dried in vacuo. The solid was then triturated in 20 mL of H<sub>2</sub>O, filtered and dried in vacuo. The azide (HPLC retention time=1.43 min.) was treated with Ph<sub>3</sub>P (0.76 mmol, 200 mg) in 10 mL of 4:1 THF/H<sub>2</sub>O for 20 h. at 60°. Solvent was removed by rotary evaporation, and the solid residue was triturated in CH<sub>2</sub>Cl<sub>2</sub> and filtered. The filter cake was washed with CH<sub>2</sub>Cl<sub>2</sub> and dried in vacuo affording 352 mg. of crude product. Reverse-phase HPLC purification of 180 mg of the crude product afforded 54 mg of the desired product. HPLC retention time=1.28 min. LC-MS: [M+H]<sup>+</sup>=1711.

Step E

[0216] Morpholinylamido-N-4-(3,4-dichlorobenzyloxy)benzyl-glucose-6-deoxy-6-amino-vancomycin

[0217] To a stirring solution of crude product from Step D (0.1 mmol, 171 mg), HOBt (0.5 mmol, 77 mg) and morpholine (1.0 mmol, 87 mg) in 4 mL of DMF cooled in an ice bath was added dropwise a 1 mL solution of PyBOP (0.14 mmol, 73 mg) in DMF. After 1 h. the product was precipitated by addition of 10 mL of Et<sub>2</sub>O. The solid was washed with Et<sub>2</sub>O and CH<sub>2</sub>Cl<sub>2</sub> and dried. The product was purified by reverse phase HPLC affording 40 mg of the titled compound. HPLC retention time=1.31 min; Mass Spec. [M+H]<sup>+</sup>1781.

## EXAMPLE 2

[0218] Hydroxyethoxyethylamido-N-4-(3,4-dichlorobenzyloxy)benzyl-glucose-6-deoxy-6-amino-vancomycin

Step A

[0219] Hydroxyethoxyethylamido-N-4-(3,4-dichlorobenzoyloxy)benzyl-glucose-6-deoxy-6-amino -vancomycin

[0220] To a solution of HPLC-purified the product from Example 1 Step D (0.01 mmol, 20 mg), HOBt (0.05 mmol, 8 mg) and hydroxyethoxyethylamine (0.1 mmol, 10 mg) in 1 mL of DMF cooled in an ice bath was added a 0.2 mL solution of PyBOP (0.015 mmol, 8 mg) in DMF. After 30 min. the product was precipitated by addition of 5 mL of

Et<sub>2</sub>O. The solid was filtered and washed with Et<sub>2</sub>O and CH<sub>2</sub>Cl<sub>2</sub> and dried. The product was purified by reverse-phase HPLC. HPLC retention time=1.24 min; Mass Spec. [M+H]<sup>+</sup>1799.

#### EXAMPLES 3, 4, 5, AND 6

[0221]

**[0224]** N-4-(3-4-dichlorobenzyloxy)benzyl-N'-allyloxy-carbonyl-glucose-6-deoxy-6azido-vancomycin

**[0225]** A slurry of the product from Step A (0.1 mmol, 156 mg) and  $\text{NaN}_3$  (1.5 mmol, 100 mg) was stirred in 3 mL of DMF at  $80^\circ$  for 5 h. The reaction was allowed to cool to ambient temperature, and the solution was filtered to remove solid  $\text{NaN}_3$ . The product was precipitated from the filtrate by addition of 30 mL of  $\text{Et}_2\text{O}$ . The solid was filtered, washed with  $\text{Et}_2\text{O}$  and  $\text{CH}_2\text{Cl}_2$  and dried in vacuo, affording 155 mg of solid.

Step C

[0226] N-4-(3,4-dichlorobenzoyloxy)benzyl-glucose-6-deoxy-6-azido-vancomycin

[0227] To a solution of the product from Step B (0.04 mmol, 80 mg) dissolved in 2 mL of DMF was added a solution of Pd2dba3 (0.003 mmol, 3 mg) and 1,4-bis (diphenylphosphino)butane (0.006 mmol, 3 mg) in THF under nitrogen atmosphere. After 30 min. the product was precipitated by addition of 30 mL of Et<sub>2</sub>O. The solid was filtered, washed with Et<sub>2</sub>O and CH<sub>2</sub>Cl<sub>2</sub> and dried in vacuo affording 77 mg of slightly greenish solid. HPLC retention time=1.48 min.

Step D

[0228] N-4-(3,4-dichlorobenzoyloxy)benzyl-glucose-6-deoxy-6-amino-vancomycin

[0229] A solution of the product from Step C (0.04 mmol, 77 mg) and Ph<sub>3</sub>P (0.19 mmol, 50 mg) in 5 mL of 4:1 THF/H<sub>2</sub>O was heated for 16 h. at 60. Solvent was removed by rotary evaporation, and the solid residue was triturated in CH<sub>2</sub>Cl<sub>2</sub> and filtered. The filter cake was washed with CH<sub>2</sub>Cl<sub>2</sub> and dried in vacuo affording 69 mg. of crude product. Reverse-phase HPLC purification of 9 mg of the crude product afforded 1.5 mg of pure product. HPLC retention time=1.32 min. LC-MS: [M+H]<sup>+</sup>=1689.

Step E

[0230] Amide species 3,4,5, and 6 were synthesized using an analogous procedure as follows: to a solution of the product from Step D (0.006 mmol, 10 mg), HOBt (0.03 mmol, 5 mg) and amine (0.1 mmol) in 0.4 mL of DMF cooled in an ice bath was added a solution of PyBOP (0.01 mmol, 5 mg) in 0.2 mL of DMF. After 30 min. the product was precipitated with 5 mL of Et<sub>2</sub>O. The solid was filtered, washed with Et<sub>2</sub>O and dried. The products were purified by reverse-phase HPLC.

[0231] 3: HPLC retention time 1.35 min; LC-MS [M+H]<sup>+</sup>1759

[0232] 4: HPLC retention time=1.32 min; LC-MS [M+H]<sup>+</sup>1821

[0233] 5: HPLC retention time=1.20 min; LC-MS [M+H]<sup>+</sup>1760

[0234] 6: HPLC retention time=1.32 min; LC-MS [M+H]<sup>+</sup> 1890

### EXAMPLES 7,8,9, AND10

[0235]

### Step A

[0236] Morpholinylamido-N-4-(3,4-dichlorobenzoyloxy)benzyl-glucose-6-deoxy-6-iodo-vancomycin

[0237] To a solution of the product from Example 1 Step C (0.1 mmol, 193 mg), HOBt (0.5 mmol, 77 mg) and morpholine (1.0 mmol, 87 mg) in 5 mL of DMF was added solid PyBOP (0.13 mmol, 68 mg). After 40 min. the product was precipitated by addition of 10 mL of Et<sub>2</sub>O. The solid was filtered, washed with Et<sub>2</sub>O and CH<sub>2</sub>Cl<sub>2</sub> and dried. The product was purified by reverse phase HPLC affording 37 mg of product. HPLC retention time=1.48 min.

[0239] 7: HPLC retention time=1.32 min; LC-MS [M+1H]<sup>+</sup> 1759

[0240] 8: HPLC retention time=1.34 min; LC-MS [M+1H]<sup>+</sup> 1821

[0241] 9: HPLC retention time=1.32 min; LC-MS [M+1H]<sup>+</sup> 1760

[0242] 10: HPLC retention time=1.28 min; LC-MS [M+1H]<sup>+</sup> 1890

# Step B

[0238] Amine species 7,8,9 and 10 were synthesized using an analogous procedure as follows: a solution of the intermediate from Step A (0.003 mmol, 6 mg) and corresponding amine (100 mg) was heated in 0.5 mL of DMF at 60° for 20 h. The product was precipitated with 7 mL of Et<sub>2</sub>O. The solid was centrifuged and the solvent decanted. Products were purified by reverse-phase HPLC.

## EXAMPLE 11

[0243]

[0244] Step A

[0245] Morpholinylamido-N-4-(3,4-dichlorobenzoyloxy)benzyl-glucose-6-deoxy-(3-5-amino-1,2,4-triazolyl)mercapto-vancomycin

[0246] A solution of the product from Example 7 Step A (0.003 mmol, 6 mg) and 5-amino-3-mercapto-1,2,4-triazole

(0.04 mmol, 5 mg) was heated in 0.5 mL of DMF at 60 ° for 20 h. The product was precipitated with 7 mL of Et<sub>2</sub>O. The solid was centrifuged and the solvent was decanted. The solid was purified by reverse-phase HPLC. HPLC retention time=1.37 min; LC-MS [M+2H]<sup>2+</sup>941.

Step A

[0247] Dimethylaminopropylamido-N-4-(3,4-dichlorobenzoyloxy)benzyl-glucose-6-deoxy-6-iodo-vancomycin

[0248] To a solution of the product from Example 1 Step C (0.02 mmol, 35 mg), HOBT (0.1 mmol, 15 mg) and 3-dimethylaminopropylamine (0.2 mmol, 20 mg) in 0.7 mL of DMF was added solid PyBOP (0.025 mmol, 13 mg). After 20 min. the product was precipitated by addition of 7 mL of Et<sub>2</sub>O. The solid was filtered, washed with Et<sub>2</sub>O and dried, affording 36 mg of crude solid. HPLC retention time=1.32 min.

[0249] Amine species 12, 13, 14, and 15 were synthesized using an analogous procedure as follows: a solution of the product from Step A (0.003 mmol, 7 mg) and corresponding amine (100 mg) was heated in 0.5 mL of DMF at 60° for 20 h. The product was precipitated with 7 mL of Et<sub>2</sub>O. The solid was centrifuged and the solvent decanted. The products were purified by reverse-phase HPLC.

[0250] 12: HPLC retention time=1.18 min; LC-MS [M+2H]<sup>2+</sup>+920

Step B

[0251] 13: HPLC retention time=1.20 min; LC-MS [M+2H]<sup>2+</sup>+943

[0252] 14: HPLC retention time=1.18 min; LC-MS [M+2H]<sup>2+</sup>+933

[0253] 15: HPLC retention time=1.15 min; LC-MS [M+2H]<sup>2+</sup>+933

[0254]

### Step A

[0256] A solution of the product from Example 12 Step A (0.003 mmol, 7 mg) and 5-amino-3-mercapto-1,2,4-triazole (0.04 mmol, 5 mg) was heated in 0.5 mL of DMF at 60° for 20 h. The product was precipitated with 7 mL of Et<sub>2</sub>O. The solid was centrifuged and the solvent decanted. The solid was purified by reverse-phase HPLC. HPLC retention time= 1.23 min; LC-MS [M+2H]<sup>2+</sup> 948.

Step A

[0258] N'-fluorenylmethoxycarbonyl-glucose-6-deoxy-6-iodovancomycin

[0259] To a stirring solution of glucose-6-deoxy-6-iodo-vancomycin (1.0 mmol, 1.56 g) and  $\text{NaHCO}_3$  (3 mmol, 252

mg) in 30 mL of 1:1 dioxane/ $\text{H}_2\text{O}$  cooled in an ice bath was added dropwise a solution of N-(fluorenylmethoxycarbo-nyloxy)succinimide (1.0 mmol, 337 mg) in 5 mL of dioxane. The reaction was allowed to reach room temperature and

stirred for 20 h. 20 mL of isopropanol was added to the reaction mixture, and the solvent was removed by rotary evaporation. The residue was triturated in 100 mL of H<sub>2</sub>O. The solid was filtered, washed with 20 mL of H<sub>2</sub>O and dried. The product was purified by reverse-phase HPLC, affording 502 mg of product. HPLC retention time 1.24 min.

mmol, 196 mg) and NaBH(OAc)<sub>3</sub> (1 mmol, 212 mg) in 3 mL of DMF containing 1.5% HOAc (v/v) was allowed to stand at room temperature. After 16 h, and additional 180 mg of NaBH(OAc)<sub>3</sub> was added, and the reaction was allowed to stand 20 h. The product was precipitated by addition of 80

# Step B

[0260] N-4-(3,4-dichlorobenzoyloxy)benzyl-N'-fluorenylmethoxycarbonyl-glucose-6-deoxy-6-iodovancomycin

[0261] A solution of the product from Step A (0.1 mmol, 170 mg), 4-(3,4-dichlorobenzoyloxy)benzaldehyde (0.7

mL of H<sub>2</sub>O, filtered, washed with H<sub>2</sub>O and dried. The crude product was triturated in CH<sub>2</sub>Cl<sub>2</sub>, filtered, dried and purified by reverse-phase HPLC, affording 49 mg. of product. HPLC retention time 2.31 min.

## Step C

[0262] N-4-(3,4-dichlorobenzoyloxy)benzyl-glucose-6-deoxy-6-iodo-vancomycin allyl ester and N-allyl-N-4-(3,4-dichlorobenzoyloxy)benzyl-glucose-6-deoxy-6-iodo-vancomycin allyl ester

[0263] To a solution of the product from Step B (0.01 mmol, 21 mg) and allyl bromide (0.05 mmol, 6 mg) in 0.4 mL of DMSO was added  $\text{NaHCO}_3$  (0.05 mmol, 4 mg). The reaction mixture was stirred at room temperature for 18 h. The product was precipitated by addition of 7 mL of  $\text{H}_2\text{O}$ .

The aqueous phase was decanted and the solid residue was dried. The solid was then taken up in 2 mL of 30% piperidine in DMF (v/v) for 30 min. The deprotected product was precipitated by addition of 10 mL of  $\text{Et}_2\text{O}$ , filtered, washed with  $\text{Et}_2\text{O}$  and dried in vacuo. HPLC analysis indicated the presence of the desired product and the N-allylated sideproduct. HPLC retention times: NH-amine=1.63 min; N allylated=1.74 min.

## Step D

[0264] N-4-(3-4-dichlorobenzoyloxy)benzyl-glucose-6-deoxy-6-amino-vancomycin allyl ester and N-allyl-N-4-(3-4-dichlorobenzoyloxybenzyl-glucose-6-deoxy-6-amino-vancomycin allyl ester

[0265] To the products from Step C dissolved in 2 mL of DMF was added  $\text{NaN}_3$  (12 mg). The reaction mixture was stirred at 65° for 24 h. The reaction was allowed to reach room temperature and solid  $\text{NaN}_3$  was removed by filtration. The filtrate was dried in vacuo and the solid residue was

trituted in  $\text{CH}_2\text{Cl}_2$ , filtered and dried. The crude azide and  $\text{Ph}_3\text{P}$  (20 mg) were dissolved in 2 mL of 4:1 THF/ $\text{H}_2\text{O}$  (v/v) and the solution was stirred at 50° for 16 h.

[0266] Solvent was removed in vacuo, and the solid residue was trituted in  $\text{CH}_2\text{Cl}_2$ , filtered and dried. Products 17 and 18 were isolated by reverse-phase HPLC. 17HPLC retention time=1.47 min; LC-MS  $[\text{M}+2\text{H}]^{2+}$  876.18HPLC retention time=1.56 min; LC-MS  $[\text{M}+2\text{H}]^{2+}$  896.

## EXAMPLE 19

[0267]

[0268] N—N'-bis-fluorenylmethoxycarbonyl-glucose-6-deoxy-6-iodovancomycin

[0269] A solution of glucose-6-deoxy-6-iodovancomycin (0.5 mmol, 780 mg), N-(fluorenylmethoxycarbonyloxysuccinimide (1.5 mmol, 506 mg) and  $\text{NaHCO}_3$  (2 mmol, 168 mg) in 10 mL of 1:1 dioxane/ $\text{H}_2\text{O}$  was stirred for 16 h. at room temperature. The reaction was stirred for 16 h. 4 mL of isopropanol was added to the reaction, and the solvent was removed by rotary evaporation. The residue was triturated in 20 mL of  $\text{CH}_2\text{Cl}_2$ , filtered and dried. HPLC retention time 2.54 min.

[0270] Glucose-6-deoxy-6-iodovancomycin methyl ester

[0271] To a solution of the product from Step A (0.5 mmol, 780 mg) and 2,6-lutidine (500  $\mu\text{L}$ ) in 10 mL of DMF was added dropwise MeI (500  $\mu\text{L}$ ). After 1 h. the reaction mixture was treated with of  $\text{Et}_2\text{O}$ , affording formation of an oily residue. The  $\text{Et}_2\text{O}$  was decanted, and the retentate was treated with 40 mL of  $\text{H}_2\text{O}$ , causing formation of a white solid. The solid was filtered and dried (HPLC retention time of bis-Fmoc species=2.12 min.). The solid was dissolved in 10 mL of 4:1 DMF/piperidine (v/v), and after 15 min. the deprotected product was precipitated by addition of 70 mL

Step B

of  $\text{Et}_2\text{O}$ . The solid was filtered, washed with  $\text{Et}_2\text{O}$  and  $\text{CH}_2\text{Cl}_2$  and dried, affording 625 mg. of solid. HPLC retention time=1.61 min.

## Step C

[0272] N-4-(3-4-dichlorobenzoyloxy)benzyl-glucose-6-deoxy-6-iodovancomycin methyl ester

[0273] The product from Step B (0.1 mmol, 157 mg), 4-(3-4-dichlorobenzoyloxy)benzaldehyde (0.1 mmol, 28 mg) and Hunig's base (0.5 mmol, 63 mg) were dissolved in 5 mL of dry DMF. The solvent was removed in vacuo. The residue was redissolved in 5 mL of dry DMF and 0.5 mmol of

Hunig's base. To the reaction mixture was added a 3 mL solution of  $\text{NaBH}(\text{OAc})_3$  (0.9 mmol, 190 mg) in DMF. The reaction was allowed to stand at room temperature for 24 h, after which time the reaction mixture became gelid. The product was precipitated by addition of 50 mL of  $\text{Et}_2\text{O}$ . The solid was filtered, dried and purified by reverse-phase HPLC, affording 17 mg. of 24. HPLC retention time=1.53 min.

## Step D

[0274] N-4-(3,4-dichlorobenzoyloxy)benzyl-glucose-6-deoxy-6-aminovancomycin methyl ester

[0275] A solution of the product from Step C (0.01 mmol, 17 mg) and  $\text{NaN}_3$  (11 mg) were stirred in 1 mL of DMF at  $70^\circ$  for 4 h. The product was precipitated by addition of 20 mL of  $\text{Et}_2\text{O}$ , filtered and dried. The solid was then triturated in 20 mL of  $\text{H}_2\text{O}$ , filtered and dried. The crude azide was

heated with  $\text{Ph}_3\text{P}$  (18 mg) in 2 mL of 4:1 THF/ $\text{H}_2\text{O}$  (v/v) at  $40^\circ$  for 20 h. The solvent was removed by rotary evaporation and the solid was triturated in  $\text{CH}_2\text{Cl}_2$ , filtered and dried. Reverse-phase HPLC purification afforded 7 mg of the titled compound. HPLC retention time=1.37 min. LC-MS  $[\text{M}+2\text{H}]^{2+}$  863.

## EXAMPLE 20

[0276] Synthesis of 3'' -N-(4-(3,4-dichlorobenzoyloxy)-benzyl)-6'-deoxy-6'-guanidiny-1-vancomycin morpholine amide, tris trifluoroacetate salt

[0277] N,N-diisopropylethylamine (0.014 mL, 0.08 mmol) was added to a solution of 3"-N-(4-(3,4-dichlorobenzoyloxy)-benzyl)-6'-deoxy-6'-amino-vancomycin morpholine amide, tris trifluoroacetate salt (14 mg, 0.0065 mmol) in anhydrous dimethylformamide (0.50 mL). 1-H-pyrazole-1-carboxamidine hydrochloride (6 mg, 0.04 mmol) was then added and the resulting mixture was stirred at room temperature overnight. After 14 hours, HPLC-MS analysis of the reaction mixture showed a mixture of starting material and product. Additional N,N-diisopropylethylamine (0.014 mL, 0.08 mmol) and 1-H-pyrazole-1-carboxamidine hydrochloride (6 mg, 0.04 mmol) were added and the reaction mixture was again stirred at room temperature overnight. After another 23 hours at room temperature (37 hours total), HPLC-MS analysis of the reaction mixture indicated that

1H, 2 br d, J=13 Hz, H-6'), 3.94 (1H, t, J=9 Hz, H-4'), 3.09 (1H, s, NCH<sub>3</sub>), 1.68 (3H, d, J=6 Hz, H-6").

[0278] Analytical HPLC for Examples 21-25 was carried out on a Zorbax SB-C8 (4.6x75 mm, 3.5  $\mu$ m packing) column, with flow of 2 ml/min and the following linear gradient of acetonitrile in water solvent (0.1% TFA): 5% to 60% from 0 to 3 min; 60% to 100% from 3 to 5 min; 100% till 6.5 min; and 100% to 5% from 6.5 to 7 min. Semi-preparative HPLC was done on Zorbax RX-C8 (9.4x250 mm, 5  $\mu$ m packing) column with 7 ml/min flow of acetonitrile/water (0.1% TFA) and appropriate gradient as specified.

#### EXAMPLE 21

[0279]

most of the starting material was gone. Ether (3.5 mL) was added and the resulting mixture (precipitate formed) was centrifuged. The supernatant was decanted off and discarded. The residual solid was purified by preparative HPLC on a Waters DeltaPak column (C18 100A, 19x300 mm) with gradient elution at 23.7 mL/min from 10:90 acetonitrile:0.1% aqueous trifluoroacetic acid to 100% acetonitrile over 15 minutes. The product peak eluted at 8.57 minutes and was collected and evaporated to afford the title compound as a white amorphous solid (12 mg, 84% yield). MS data: m/e 912 ((M+2)/2). Selected <sup>1</sup>H NMR data (500 MHz NMR in pyridine-d<sub>5</sub> at 40° C., referenced to internal TMS):  $\delta$  6.03 (1H, d, J=4 Hz, H-1"), 5.96 (1H, d, J=8 Hz, H-1"), 5.43 (1H, br q, J=6 Hz, H-5"), 4.90 (2H, s, OCH<sub>2</sub>Ar), 4.41 (2H, br s, NCH<sub>2</sub>Ar), 4.22 (1H, br s, H-4"), 4.10 & 3.80 (2x

[0280] A solution of dimethylaminopropylamine (6  $\mu$ l, 51  $\mu$ mole) in dried DMF (100  $\mu$ l) was added to a test tube containing the vancomycin derivative prepared as in Example 1 Step D (7 mg, 3.4  $\mu$ mole), HOBT (2.7 mg, 20  $\mu$ mole) and PyBOP (2.1 mg, 4  $\mu$ mole). The resulting clear solution was stirred for 1 hr at room temperature. The solvent and excess amine were removed by rotary evaporation (water bath kept at 25° C.), and the residue was dissolved in 2 ml of CH<sub>3</sub>CN:H<sub>2</sub>O (1:8, containing ~1% TFA). Preparative HPLC (acetonitrile in water: 20% to 35% from 0 to 2 min; 35% isocratic till 7 min; 35% to 100% from 7 to 8 min), after lyophilization, afforded 3.3 mg of product, with observed m/e of 898.4 (doubly charged molecular ion) and analytical HPLC retention time of 3.82 min.

## EXAMPLE 22

[0281]

[0282] A solution of butanediamine (7 mg, 75  $\mu$ mole) in dried DMF (200  $\mu$ l) was added to a test tube containing the vancomycin derivative prepared as in Example 1 Step D (15.5 mg, 7.54  $\mu$ mole), HOBt (6 mg, 45  $\mu$ mole) and PyBOP (4.7 mg, 9  $\mu$ mole). A large amount of white solid precipitated out (butanediamine salt). The suspension was stirred for 2 hr at room temperature. The solvent was removed by rotary

evaporation (water bath kept at 25° C.), and the residue was dissolved in 2 ml of CH<sub>3</sub>CN:H<sub>2</sub>O (1:4, containing ~1% TFA). Preparative HPLC (acetonitrile in water: 20% to 32% from 0 to 1 min; 32% isocratic till 7 min; 32% to 100% from 7 to 8 min), after lyophilization, afforded 9.8 mg of product, with observed m/e of 892.5 (doubly charged molecular ion) and analytical HPLC retention time of 3.80 min.

## EXAMPLE 23

[0283]

[0284] A solution of diethylenetriamine (8 mg, 75  $\mu$ mole) in dried DMF (200  $\mu$ l) was added to a test tube containing the vancomycin derivative prepared as in Example 1 Step D (15.5 mg, 7.54  $\mu$ mole), HOBt (6 mg, 45  $\mu$ mole) and PyBOP (4.3 mg, 8.3  $\mu$ mole). The resulting clear solution was stirred for 1 hr at room temperature. The solvent was removed by rotary evaporation (water bath kept at 25° C.), and the

residue was dissolved in 2 ml of CH<sub>3</sub>CN:H<sub>2</sub>O (1:9, containing ~1% TFA). Preparative HPLC (acetonitrile in water: 20% to 32% from 0 to 1 min; 32% isocratic till 7 min; 32% to 100% from 7 to 8 min), after lyophilization, afforded 2.5 mg of product, with observed m/e of 899.0 (doubly charged molecular ion.)

Step A

[0285] G6-Iodovancosamine (440 mg, 0.25 mmole) was stirred with NaN<sub>3</sub> (160 mg, 2.5 mmole) in dried DMF (6 ml, N<sub>2</sub> purged before use) at 60° C. for 16 hr. Excess NaN<sub>3</sub> was filtered off, and the solution was dropped into ether (200 ml). The solid was collected, washed with more ether, dried in air. This crude product was stirred with PPh<sub>3</sub> (320 mg, 1.25

mmole) in 11 ml of THF-H<sub>2</sub>O (5:1, N<sub>2</sub> purged before use) at 60° C. for 20 hr. The solvent was removed on a rotary-evaporator, and the residue dissolved in 7 ml of DMF. This was added to ether (200 ml). The solid was collected, washed with DCM and dried in air. The crude product was dissolved in 13 ml of CH<sub>3</sub>CN:H<sub>2</sub>O (1:9, 0.2% TFA) and

purified in preparative HPLC (10% to 25% from 0 to 5 min; 25% to 100% from 5 to 5.5 min; 100% from 5.5 min to 7 min; 100% to 10% from 7 to 7.5 min) to give, after lyophilization, 177 mg (40%) of white powder, with observed m/e of 724 (doubly charged molecular ion) and HPLC retention time of 2.80 min.

[0286] G6-amino-vancosamine TFA salt (46.0 mg, 25.7 umole), 4-(4-(3,4-dichlorobezoyloxy)benzylamino)butylamine TFA salt (47 mg, 81 umole), HOBt (28 mg, 210 umole), DIEA (28 ul, 160 umole) were dissolved in dry DMF (800ul). A solution of PyB OP (27 mg, 51 umole) in DMF (200 ul) was added dropwise. The resulting clear

#### Step B

solution was stirred at room temperature for 45 min. The whole reaction mixture was added to ether (35 ml). The solid was collected, washed with more ether, and dried in air. The solid was dissolved in 6 ml of 1:4 CH<sub>3</sub> CN:H<sub>2</sub>O (~1% TFA) and purified on the preparative HPLC in three runs (10% to 35% from 0 to 1 min; 35% isocratic till 7 min; 35% to 100% from 7 to 8 min) to give, after lyophilization, 28.2 mg of product with observed m/e of 891.5 (doubly charged molecular ion) and HPLC retention time of 3.92 min.

## EXAMPLE 25

[0287]

[0288] G6-amino-vancosamine TFA salt prepared in Example 24 Step A (37 mg, 21 umole), 5-(4-(3,4-dichlorobenzoyloxy)benzylamnio)pentylamine TFA salt (60 mg, 100 umole), HOBt (16 mg, 120 umole), DIEA (72 ul, 400 umole) were dissolved in dry DMF (500 ul) and cooled in ice/water bath. A solution of PyBOP (13.1 mg, 25 umole) in DMF (130 ul) was added dropwise. The cooling bath was removed and the clear solution was stirred for 1 hr. The reaction was monitored with HPLC. More PyBOP was added until

G6-aminovancosamine is completely converted, 3 more equivalent of PyBOP was eventually used. The whole reaction mixture was added to ether (35 ml). The solid was collected, washed with more ether, and dried in air. Preparative HPLC in three runs (10% to 37% from 0 to 1 min; 37% isocratic till 7 min; 37% to 100% from 7 to 8 min) to give, after lyophilization, 8.3 mg of product with observed m/e of 898.5 (doubly charged molecular ion) and HPLC retention time of 3.94 min.

What is claimed is:

1. A compound of the formula:

$R^1$  is  $XR^a$ ; wherein X is absent or  $XR^a$  is —

— $SO_2R^a$ , — $SO_2NR^aR^a$ , — $COOR^a$ , — $CONR^aR^a$ ,  
—COR when  $R^a$  is not hydrogen;

each  $R^a$  is independently hydrogen, alkyl, aryl, heteroaryl, substituted alkyl, substituted aryl, substituted heteroaryl; wherein

(i) each of the substituents on substituted alkyl is independently

- (a) halogen,
- (b) cyano,
- (c)  $OR^b$
- (d)  $NR^bR^c$
- (e)  $COOR^b$
- (f)  $CONR^bR^c$ ,
- (g)  $SR^b$
- (h) — $SO_2R^b$
- (i)  $SO_2NR^bR^b$
- (j) aryl,

(k) aryl substituted with one or more substituents independently selected from halogen, cyano,  $OR^b$ ,

$SR^b$ ,  $COOR^b$ ,  $CONR^bR^c$ ,  $NR^bR^c$ ,  $SO_2R^b$ ,  $SO_2NR^bR^c$ , alkyl, alkyl substituted with  $R^b$ , fluorinated alkyl, alkenyl, alkenyl substituted with  $R^b$ , alkynyl, alkynyl substituted with  $R^b$ , aryl, aryl substituted with  $R^b$ , heteroaryl, and heteroaryl substituted with  $R^b$ ;

(l) heterocycle, or

(m) heteroaryl substituted with one or more substituents independently selected from halogen, cyano,  $OR^b$ ,  $SR^b$ ,  $COOR^b$ ,  $CONR^bR^c$ ,  $NR^bR^c$ ,  $SO_2R^b$ ,  $SO_2NR^bR^c$ , alkyl, alkyl substituted with  $R^b$ , fluorinated alkyl, alkenyl, alkenyl substituted with  $R^b$ , alkynyl, alkynyl substituted with  $R^b$ , aryl, aryl substituted with  $R^b$ , heteroaryl, and heteroaryl substituted with  $R^b$ ;

(ii) each of the substituents on substituted aryl is independently

- (a) halogen,
- (b) cyano,
- (c)  $OR^b$
- (d)  $NR^bR^c$
- (e)  $COOR^b$
- (f)  $CONR^bR^c$ ,

- (g)  $SR^b$
- (h)  $SO_2R^b$
- (i)  $SO_2NR^bR^c$
- (j) aryl,
- (k) aryl substituted with one or more substituents independently selected from halogen, cyano,  $OR^b$ ,  $SR^b$ ,  $COOR^b$ ,  $CONR^bR^c$ ,  $NR^bR^c$ ,  $SO_2R^b$ ,  $SO_2NR^bR^c$ , alkyl, alkyl substituted with  $R^b$ , fluorinated alkyl, alkenyl, alkenyl substituted with  $R^b$ , alkynyl, alkynyl substituted with  $R^b$ , aryl, aryl substituted with  $R^b$ , heteroaryl, and heteroaryl substituted with  $R^b$ ;
- (l) heterocycle, or
- (m) heteroaryl substituted with one or more substituents independently selected from halogen, cyano,  $OR^b$ ,  $SR^b$ ,  $COOR^b$ ,  $CONR^bR^c$ ,  $NR^bR^c$ ,  $SO_2R^b$ ,  $SO_2NR^bR^c$ , alkyl, alkyl substituted with  $R^b$ , fluorinated alkyl, alkenyl, alkenyl substituted with  $R^b$ , alkynyl, alkynyl substituted with  $R^b$ , aryl, aryl substituted with  $R^b$ , heteroaryl, and heteroaryl substituted with  $R^b$ ;
- (n) alkyl,
- (o) alkyl substituted with  $R^b$ ;
- (p) alkenyl,
- (q) alkenyl substituted with  $R^b$ ;
- (r) alkynyl,
- (s) alkynyl substituted with  $R^b$ ;
- (iii) each of the substituents on substituted heteroaryl is independently
  - (a) halogen,
  - (b) cyano,
  - (c)  $OR^b$
  - (d)  $NR^bR^c$
  - (e)  $COOR^b$
  - (f)  $CONR^bR^c$ ,
  - (g)  $SR^b$
  - (h)  $SO_2R^b$
  - (i)  $SO_2NR^bR^c$
  - (j) aryl,
  - (k) aryl substituted with one or more substituents independently selected from halogen, cyano,  $OR^b$ ,  $SR^b$ ,  $COOR^b$ ,  $CONR^bR^c$ ,  $NR^bR^c$ ,  $SO_2R^b$ ,  $SO_2NR^bR^c$ , alkyl, alkyl substituted with  $R^b$ , fluorinated alkyl, alkenyl, alkenyl substituted with  $R^b$ , alkynyl, alkynyl substituted with  $R^b$ , aryl, aryl substituted with  $R^b$ , heteroaryl, heteroaryl substituted with  $R^b$ ;
  - (l) heterocycle, or
  - (m) heteroaryl substituted with one or more substituents independently selected from halogen, cyano,  $OR^b$ ,  $SR^b$ ,  $COOR^b$ ,  $CONR^bR^c$ ,  $NR^bR^c$ ,  $SO_2R^b$ ,  $SO_2NR^bR^c$ , alkyl, alkyl substituted with  $R^b$ , fluori-

nated alkyl, alkenyl, alkenyl substituted with  $R^b$ , alkynyl, alkynyl substituted with  $R^b$ , aryl, aryl substituted with  $R^b$ , heteroaryl, and heteroaryl substituted with  $R^b$ ;

- (n) alkyl,
- (o) alkyl substituted with  $R^b$ ;
- (p) alkenyl,
- (q) alkenyl substituted with  $R^b$ ;
- (r) alkynyl,
- (s) alkynyl substituted with  $R^b$ ;

or  $R^a$  and  $R^a$  together with the nitrogen to which they are attached form  $C_3$ - $C_6$  heterocycloalkyl consisting of from 2 to 5 carbons atoms and from 1 or 2 nitrogen, oxygen, and sulfur atoms. The heterocycloalkyl may be substituted with alkyl, aryl, heteroaryl,  $OR^b$ ,  $NR^bR^c$ ,  $COOR^b$ ,  $CONR^bR^c$ , substituted alkyl, substituted aryl, or substituted heteroaryl as defined above;

$R^b$  and  $R^c$  are each independently hydrogen, alkyl, aryl, heteroaryl, substituted alkyl substituted with 1 to 3 groups of  $R^x$ , substituted aryl substituted with 1 to 3 groups of  $R^y$ , or substituted heteroaryl substituted with 1 to 3 groups of  $R^z$ ; wherein

(i) wherein  $R_x$  represents:

- (a) halogen,
- (b) cyano,
- (c) OH, O-alkyl
- (d)  $N(alkyl)_2$ , NH-alkyl
- (e) OOH, COO-alkyl
- (f)  $CON(alkyl)_2$ , CONH-alkyl,
- (g)  $SO_2N(alkyl)_2$ ,  $SO_2NH$ -alkyl,
- (h) aryl,

(i) aryl substituted with one or more substituents independently selected from halogen, cyano, hydroxy, O-alkyl, alkyl, fluorinated alkyl, COOH, COO-alkyl, CONH-alkyl,  $CON(alkyl)_2$ , and  $N(alkyl)_2$ ;

(j) heterocycle, or

(k) heterocycle substituted with one or more substituents independently selected from halogen, cyano, hydroxy, O-alkyl, alkyl, fluorinated alkyl, COOH, COO-alkyl, CONH-alkyl,  $CON(alkyl)_2$ , and  $N(alkyl)_2$ ;

(ii) wherein  $R^y$  represents:

- (a) halogen,
- (b) cyano,
- (c) OH, O-alkyl
- (d)  $N(alkyl)_2$ , NH-alkyl
- (e) COOH, COO-alkyl
- (f)  $CON(alkyl)_2$ , CONH-alkyl,
- (g)  $SO_2N(alkyl)_2$ ,  $SO_2NH$ -alkyl

(h) aryl,

(i) aryl substituted with one or more substituents independently selected from halogen, cyano, hydroxy, O-alkyl, alkyl, fluorinated alkyl, COOH, COO-alkyl, CONH-alkyl, CON(alkyl)2, and N(alkyl)2;

(j) heterocycle, or

(k) heterocycle substituted with one or more substituents independently selected from halogen, cyano, hydroxy, O-alkyl, alkyl, fluorinated alkyl, COOH, COO-alkyl, CONH-alkyl, CON(alkyl)2, and N(alkyl)2;

(iii) wherein  $R^z$  represents:

(a) halogen,

(b) cyano,

(c) OH, O-alkyl

(d) N(alkyl)2, NH-alkyl

(e) COOH, COO-alkyl

(f) CON(alkyl)2, CONH-alkyl,

(g) SO<sub>2</sub>N(alkyl)2, SO<sub>2</sub>NH-alkyl

(h) aryl,

(i) aryl substituted with one or more substituents independently selected from halogen, cyano, hydroxy, O-alkyl, alkyl, fluorinated alkyl, COOH, COO-alkyl, CONH-alkyl, CON(alkyl)2, and N(alkyl)2;

(j) heterocycle, or

(k) heterocycle substituted with one or more substituents independently selected from halogen, cyano, hydroxy, O-alkyl, alkyl, fluorinated alkyl, COOH, COO-alkyl, CONH-alkyl, CON(alkyl)2, and N(alkyl)2;

or R<sub>b</sub> and R<sub>c</sub> together with the nitrogen to which they are attached form C<sub>3</sub>-C<sub>6</sub> heterocycloalkyl consisting of from 2 to 5 carbons atoms and from 1 to 2 nitrogen, oxygen, and sulfur atoms, and wherein heterocycloalkyl may be substituted with alkyl, aryl, heteroaryl, O-alkyl, NHalkyl, COOH, COO-alkyl, CONH-alkyl, CON(alkyl)2, SO<sub>2</sub>N(alkyl)2, SO<sub>2</sub>NH-alkyl, substituted alkyl, substituted aryl, or substituted heteroaryl as previously defined above in R<sup>x</sup>, R<sup>y</sup>, R<sup>z</sup>, respectively;

R<sub>2</sub> is NR<sup>a</sup>R<sup>a</sup>, SR<sup>a</sup>,

and OR<sup>a</sup> wherein OR is not OH;

R<sup>3</sup> is CONR<sup>a</sup>R<sup>a</sup> or COOR<sup>a</sup> wherein COOR<sup>a</sup> is not COOH and R<sup>a</sup> does not contain as a sub-structure a generally recognized antibacterial agent.

2. The compound according to claim 1, wherein R<sup>1</sup> is XR<sup>a</sup>; wherein X is absent and R<sup>a</sup> is defined as in claim 1, R<sup>2</sup> is NR<sup>a</sup>R<sup>a</sup>, SR<sup>a</sup>,

and OR<sup>a</sup> is not OH; R<sup>3</sup> is CONR<sup>a</sup>R<sup>a</sup> or COOR<sup>a</sup> wherein COOR<sup>a</sup> is not COOH and R<sup>a</sup> does not contain as a sub-structure a generally recognized antibacterial agent.

3. The compound according to claim 2, wherein

R<sup>1</sup> is XR<sup>a</sup> wherein X is absent and each R<sup>a</sup> is independently hydrogen, alkyl, and substituted alkyl; wherein

(i) each of the substituents on substituted alkyl is independently

(a) halogen,

(b) cyano,

(c) OR<sup>b</sup>

(d) NR<sup>b</sup>R<sup>c</sup>

(e) COOR<sup>b</sup>

(f) CONR<sup>b</sup>R<sup>c</sup>,

(g) SR<sup>b</sup>

(h) SO<sub>2</sub>R<sup>b</sup>

(i) SO<sub>2</sub>NR<sup>b</sup>R<sup>b</sup>

(j) aryl,

(k) aryl substituted with one or more substituents independently selected from halogen, cyano, OR<sup>b</sup>, SR<sup>b</sup>, COOR<sup>b</sup>, CONR<sup>b</sup>R<sup>c</sup>, NR<sup>b</sup>R<sup>c</sup>, SO<sub>2</sub>R<sup>b</sup>, SO<sub>2</sub>NR<sup>b</sup>R<sup>c</sup>, alkyl, alkyl substituted with R<sup>b</sup>, fluorinated alkyl, alkenyl, alkenyl substituted with R<sup>b</sup>, alkynyl, alkynyl substituted with R<sup>b</sup>, aryl, aryl substituted with R<sup>b</sup>, heteroaryl, and heteroaryl substituted with R<sup>b</sup>;

(l) heterocycle, or

(m) heteroaryl substituted with one or more substituents independently selected from halogen, cyano, OR<sup>b</sup>, SR<sup>b</sup>, COOR<sup>b</sup>, CONR<sup>b</sup>R<sup>c</sup>, NR<sup>b</sup>R<sup>c</sup>, SO<sub>2</sub>R<sup>b</sup>, SO<sub>2</sub>NR<sup>b</sup>R<sup>c</sup>, alkyl, alkyl substituted with R<sup>b</sup>, fluorinated alkyl, alkenyl, alkenyl substituted with R<sup>b</sup>, alkynyl, alkynyl substituted with R<sup>b</sup>, aryl, aryl substituted with R<sup>b</sup>, heteroaryl, and heteroaryl substituted with R<sup>b</sup>;

or R<sup>a</sup> and R<sup>a</sup> together with the nitrogen to which they are attached form C<sub>3</sub>-C<sub>6</sub> heterocycloalkyl consisting of from 2 to 5 carbons atoms and from 1 or 2 nitrogen, oxygen, and sulfur atoms; and the heterocycloalkyl may be substituted with alkyl, aryl, heteroaryl, OR<sup>b</sup>, NR<sup>b</sup>R<sup>b</sup>, COOR<sup>b</sup>, CONR<sup>b</sup>R<sup>c</sup>, substituted alkyl, substituted aryl, or substituted heteroaryl as defined above; and

R<sup>2</sup> and R<sup>3</sup> are as defined in claim 2.

4. A vancomycin analog according to claim 1, wherein R<sup>1</sup> is unsubstituted or substituted benzyloxybenzyl wherein the substituent is one or more halogens.

5. A vancomycin analog according to claim 4, wherein the substituent is chlorine.

6. A vancomycin analog according to claim 2, wherein  $R^1$  is 3,4-dichlorobenzoyloxybenzyl.
7. A vancomycin analog according to claim 1, wherein  $R^2$  is selected from the group consisting of amino, hydroxyalkylamino, phenylalkylamino, or a heterocyclic group.
8. A vancomycin analog according to claim 4, wherein  $R^2$  is amino.
9. A vancomycin analog according to claim 4, wherein  $R^2$  is hydroxyethylamino.
10. A vancomycin analog according to claim 4, wherein  $R^2$  is phenethylamino.
11. A vancomycin analog according to claim 4, wherein  $R^2$  is morpholino.
12. A vancomycin analog according to claim 4, wherein  $R^2$  is piperidino.
13. A vancomycin analog according to claim 1, wherein  $R^3$  is selected from the group consisting of morpholinoamido, hydroxyalkoxyalkyleneamido, amino alkyleneamido and azidoalkoxyalkoxyalkoxyalkyleneamido.
14. A vancomycin analog according to claim 13, wherein  $R^3$  is morpholineamido.
15. A vancomycin analog according to claim 13, wherein  $R^3$  is hydroxyethoxyethoxyethyleneamino.
16. A vancomycin analog according to claim 13, wherein  $R^3$  is aminobutyleneamino.
17. A vancomycin analog according to claim 13, wherein  $R^3$  is azidoethoxyethoxyethyleneamino.
18. A compound according to claim 1, wherein  $R^1$  is 3,4-dichlorobenzoyloxybenzyl,  $R^2$  is  $NH_2$ , and  $R^3$  is morpholinoamido.
19. A compound according to claim 1, wherein  $R^1$  is (3,4-dichlorobenzoyloxy)benzyl,  $R^2$  is  $NH_2$ , and  $R^3$  is hydroxyethoxyethylamido.
20. A compound according to claim 1, wherein  $R^1$  is p-biphenylbenzyl,  $R^2$  is  $NH_2$ , and  $R^3$  is morpholineamido.
21. A compound according to claim 1, wherein  $R^1$  is p-biphenylbenzyl,  $R^2$  is  $NH_2$ , and  $R^3$  is hydroxyethoxyethoxyethylamido.
22. A compound according to claim 1, wherein  $R^1$  is p-biphenylbenzyl,  $R^2$  is  $NH_2$ , and  $R^3$  is aminobutylamido.
23. A compound according to claim 1, wherein  $R^1$  is p-biphenylbenzyl,  $R^2$  is  $NH_2$ , and  $R^3$  is azidoethoxyethoxyethoxyethylamido.
24. A compound according to claim 1, wherein  $R^1$  is (3,4-dichlorobenzoyloxy)benzyl,  $R^2$  is hydroxyethylamino, and  $R^3$  is morpholineamido.
25. A compound according to claim 1, wherein  $R^1$  is (3,4-dichlorobenzoyloxy)benzyl,  $R^2$  is benzylamino, and  $R^3$  is morpholineamido.
26. A compound according to claim 1, wherein  $R^1$  is (3,4-dichlorobenzoyloxy)benzyl,  $R^2$  is morpholino and  $R^3$  is morpholineamido.
27. A compound according to claim 1, wherein  $R^1$  is (3,4-dichlorobenzoyloxy)benzyl,  $R^2$  is piperidino, and  $R^3$  is morpholineamido.
28. A compound according to claim 1, wherein  $R^1$  is (3,4-dichlorobenzoyloxy)benzyl,  $R^2$  is (3,5-amino-2,4-triazolyl)mercapto,  $R^3$  is morpholineamido.
29. A compound according to claim 1, wherein  $R^1$  is (3,4-dichlorobenzoyloxy)benzyl,  $R^2$  is hydroxyethylamino, and  $R^3$  is dimethylaminopropylamido.
30. A compound according to claim 1, wherein  $R^1$  is (3,4-dichlorobenzoyloxy)benzyl,  $R^2$  is benzylamino, and  $R^3$  is dimethylaminopropylamido.
31. A compound according to claim 1, wherein  $R^1$  is (3,4-dichlorobenzoyloxy)benzyl,  $R^2$  is morpholino, and  $R^3$  is dimethylaminopropylamido.
32. A compound according to claim 1, wherein  $R^1$  is (3,4-dichlorobenzoyloxy)benzyl,  $R^2$  is piperidino, and  $R^3$  is dimethylaminopropylamido.
33. A compound according to claim 1, wherein  $R^1$  is (3,4-dichlorobenzoyloxy)benzyl,  $R^2$  is (3,5-amino-1,2,4-triazolyl)mercapto, and  $R^3$  is dimethylaminopropylamido.
34. A compound according to claim 1, wherein  $R^1$  is (3,4-dichlorobenzoyloxy)benzyl,  $R^2$  is  $NH_2$ , and  $R^3$  is allyloxy carbonyl.
35. A compound according to claim 1, wherein  $R^1$  is (3,4-dichlorobenzoyloxy)benzyl,  $R^2$  is  $NH_2$ , and  $R^3$  is methoxycarbonyl.
36. A compound according to claim 1, wherein  $R^1$  is (3,4-dichlorobenzoyloxy)benzyl,  $R^2$  is  $NH_2$ , and  $R^3$  is morpholineamido.
37. The tris trifluoroacetate salt of the compound of claim 36.
38. A compound according to claim 1, wherein  $R^1$  is (3,4-dichlorobenzoyloxy)benzyl,  $R^2$  is  $NH_2$ , and  $R^3$  is dimethylaminopropylamido.
39. A compound according to claim 1, wherein  $R^1$  is (3,4-dichlorobenzoyloxy)benzyl,  $R^2$  is  $NH_2$ , and  $R^3$  is aminobutyleneamido.
40. A compound according to claim 1, wherein  $R^1$  is (3,4-dichlorobenzoyloxy)benzyl,  $R^2$  is  $NH_2$ , and  $R^3$  is aminoethylaminoethylamido.
41. A compound according to claim 1, wherein  $R^1$  is  $NH_2$ ,  $R^2$  is  $NH_2$ , and  $R^3$  is (3,4-dichlorobenzoyloxy)benzyl aminobutyleneamido.
42. A compound according to claim 1, wherein  $R^1$  is  $NH_2$ ,  $R^2$  is  $NH_2$ , and  $R^3$  is (3,4-dichlorobenzoyloxy)benzyl aminopentyleneamido.
43. A pharmaceutical composition comprising the analog of claim 1 or its pharmaceutically acceptable salt in combination with a pharmaceutically acceptable carrier.
44. A method of treating or preventing a bacterial infection in a mammalian patient in need thereof, comprising administering to said patient an effective amount of the analog of claim 1.
